

PLANE PRINT

Reno Air race biplane

NOTE:
Slicing works best
with CURA!

www.planeprint.com

the **ONLY** place where you can get
original Planeprint STL files **legally!**

PLANE PRINT

'WANNA
PLAY II'

Required accessoires

Filament

- LW-PLA (**cannot be replaced by PLA!**), ~1500 grams
- PLA oder better **Tough PLA**, ~320 grams
- TPU A95, ~20 grams
- LW-TPU Colorfabb VarioShore about 100 grams
(strongly recommended for tires, but it also works with normal TPU)

Materials

- some tapping screws
(search for: **M2 flat head tapping screw assortment**)
- CA super glue (liquid and liquid medium)
- CA activator
- Metal screw 3*40mm with nuts (not self-locking!), 4 pieces
- Metal screw 3*20mm with self-locking nuts, 4 pieces
- Metal screw 3*30mm, 2 pieces
- Ball bearings 3x6x2,5mm, 4 pieces
- Carbon tube Ø8mm*1000mm (inside 6mm), 4 pieces*
- Carbon rod Ø3*1000mm, 1 piece*
- Steel wire Ø1*1000mm, 2 pieces
- Self-adhesive Velcro tape
- Velcro strap
- Servo cable extension 350mm, 2 pieces
- Rod connection, 4 pieces
- Neodym-Super-Magnet 5x5x5mm, 4 pieces
- some Hair gums
- some lead to correct the CG

Tools

Cutter knife, small Philips screwdriver, Sandpaper, Metal saw, Needle nose pliers.

***Cut the 8mm tubes into the following parts:**

Tube 1 for the gear: 2x125, 2x158

Tube 2 for the wings: 2x500

Tube 3 for the wings and HS: 1x800, 1x120

Tube 4 for the wing: 1x1000 (do not cut)

***Cut the 3mm rod into the following parts:**

Motormount: 4x200

Tapping screws 2mm

Rod connection

Metal screw 3*40mm, 3*20

Carbon tube

Magnet 5x5x5mm

Hair gums

Ball bearings

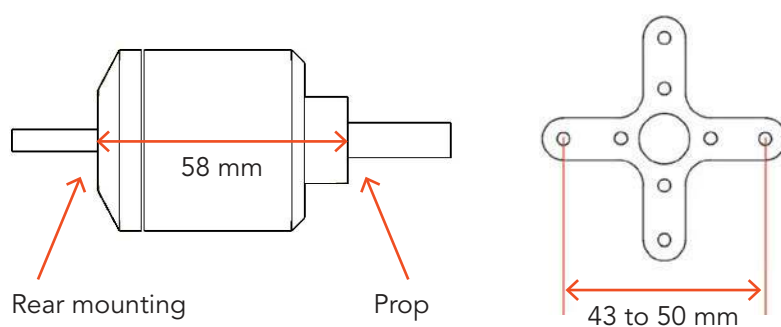

RC Components

ENGINE

PROPDRIVE V2 3548 900KV (HobbyKing) or comparable motors.

You can also use any other motor that fits a 14x7 propeller!

NOTE This motorization is very powerful. The Wanna Play is not full throttle safe with it. Always be careful, it is up to your discretion and the quality of your printing and assembly as to what stresses the aircraft can withstand.

The optimal length of the motor is when the distance to the back of the prop is 58 mm. If the motor is shorter, you can use longer screws and washers. If the motor is longer, the motor cross can also be mounted behind the motor mount. In this case the diameter of the motor must not be more than 35 mm!

PROP

12x7 or 14x6

BEC-CONTROLLER

80 A (must fit the engine!)

RECEIVER

5 Channel

BATTERY

4S Lipo, 3500 – 5000 MaH
(The battery should have a weight of 400 to 450 grams)

SERVOS

4 pieces like **Corona DS-238MG** or comparable

Dimensions (The optimal distance between screws is 35 mm):

Printing the parts – Printing profiles

This manual is constantly being improved and supplemented, we recommend downloading the **latest version** from our website **before building**.

For slicing all Planeprint models, these profiles have to be created in Cura:

PROFILE P1_Fullbody
PROFILE P2_Hollowbody
PROFILE P3_Surface (Not necessary for this plane)
PROFILE P4_Flex
PROFILE P5_Gyroid

You can find the description at www.planepprint.com/print

Important for the 1-wall-print (P3, P5)!

In order to print airfoils of the lowest possible weight with high stability, it is necessary to print with only one wall line (Nozzle 0.4 mm). Decisive here is the adhesion between the layers! To achieve this, you must print at a much higher temperature than normal. As a **guideline**, 230° C is a good starting point. The parts-cooling fan should be set to 0% or a maximum of 20%. Since not every printer works the same, it may be necessary to make small adjustments to these settings.

For the new PROFILE P5_Gyroid it is essential to use **Cura Version 5 or later**, It will work with older versions, but the weight of the parts will be higher and the printing time longer.

PROFILE P5_Gyroid

It is **essential for the necessary stability** of the **LW parts printed with PROFILE_5** are as stable as possible. Please use a test part to check the strength by fracture tests. It must not break along the layer lines under any circumstances! Also note that the printing temperature for LW-PLA is as low as possible to obtain a wall thickness of 0.4 to 0.6 mm at a flow of 60 to 70 % (depending on brand).

Caution: at too high temperatures, LW-PLA becomes brittle and breaks more easily.

The development of a complex, airworthy RC flight model to express on any standard 3D printer is a very complex and extensive process. Therefore, we appeal to your fairness not to forward the STL data you have acquired to third parties.

Thank you for your understanding and have fun with your PLANEPRINT MODEL!

PROFILE P1_Fullbody **PLA or Tough PLA**

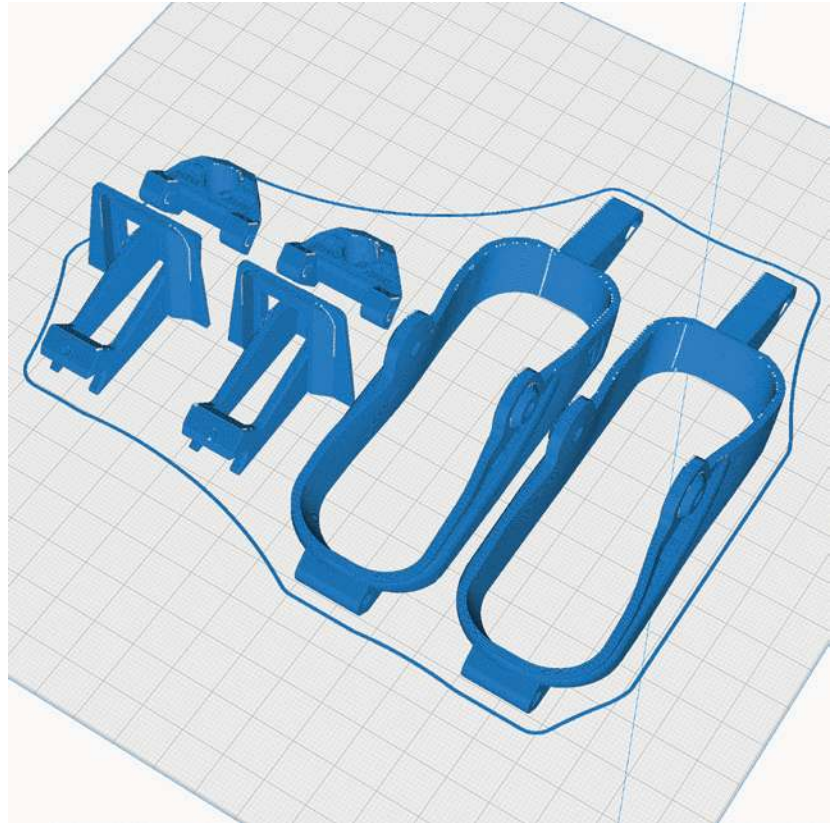

The following parts must be sliced with the PROFILE P1_Fullbody.
Please note the additional settings for the individual parts!

P1_Gear parts_wp.stl

MATERIAL PLA, Weight: ~ 45 g

ADDITIONAL SETTINGS

None required

P1_Interconnects_wp.stl

MATERIAL PLA, Weight: ~ 3 g

ADDITIONAL SETTINGS

None required

PROFILE P1_Fullbody **PLA or Tough PLA**

The following parts must be sliced with the PROFILE P1_Fullbody.
Please note the additional settings for the individual parts!

P1_Motormount_base_wp.stl

MATERIAL PLA, Weight: ~ 21 g

ADDITIONAL SETTINGS

None required

P1_Motormount_wp.stl

MATERIAL PLA, Weight: ~ 18 g

ADDITIONAL SETTINGS

None required

PROFILE P1_Fullbody **PLA or Tough PLA**

The following parts must be sliced with the PROFILE P1_Fullbody.
Please note the additional settings for the individual parts!

P1_Parts_wp.stl

MATERIAL PLA, Weight: ~ 19 g

ADDITIONAL SETTINGS

None required

P1_Protectors FUS_wp.stl

MATERIAL PLA, Weight: ~ 11 g

ADDITIONAL SETTINGS

None required

PROFILE P1_Fullbody PLA or Tough PLA

The following parts must be sliced with the PROFILE P1_Fullbody.
Please note the additional settings for the individual parts!

P1_Protectors WING_wp.stl

MATERIAL PLA, Weight: ~ 11 g

ADDITIONAL SETTINGS

None required

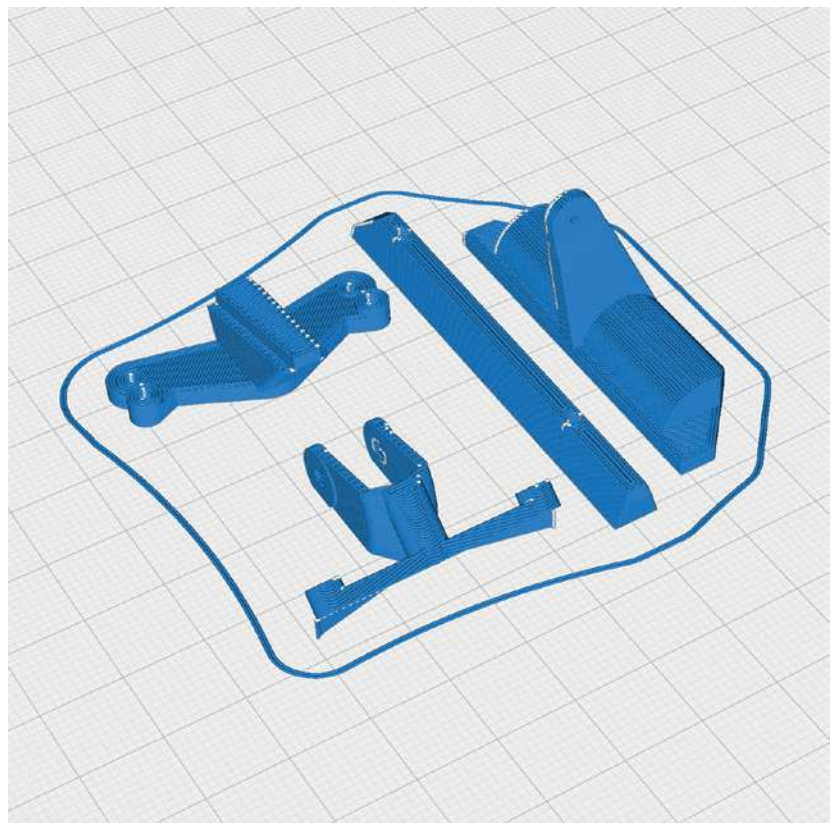

P1_Parts rear_wp.stl

MATERIAL PLA, Weight: ~ 9 g

ADDITIONAL SETTINGS

None required

Remove support.
Please be careful with the knife!

PROFILE P1_Fullbody PLA or Tough PLA

The following parts must be sliced with the PROFILE P1_Fullbody.
Please note the additional settings for the individual parts!

P1_Rear gear_wp.stl

MATERIAL PLA, Weight: ~ 4 g

ADDITIONAL SETTINGS

None required

P1_Servo board 35mm_wp.stl or P1_Servo board customizable_wp.stl

MATERIAL PLA, Weight: ~ 5 g

ADDITIONAL SETTINGS

None required

PROFILE P1_Fullbody **PLA or Tough PLA**

The following parts must be sliced with the PROFILE P1_Fullbody.
Please note the additional settings for the individual parts!

P1_Spinner plate 6_wp.stl

MATERIAL PLA, Weight: ~ 12 g

ADDITIONAL SETTINGS

None required

P1_Strut parts_wp.stl

MATERIAL PLA, Weight: ~ 7 g

ADDITIONAL SETTINGS

None required

PROFILE P1_Fullbody **PLA or Tough PLA**

The following parts must be sliced with the PROFILE P1_Fullbody.
Please note the additional settings for the individual parts!

P1_Winglets_wp.stl

MATERIAL PLA, Weight: ~ 11 g

ADDITIONAL SETTINGS

None required

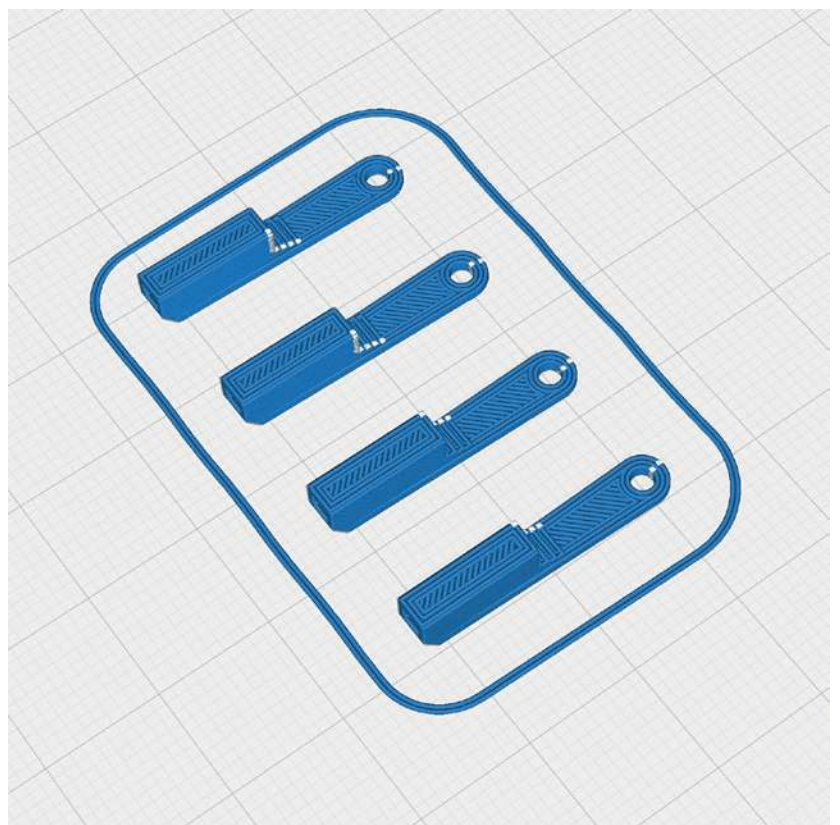

P1_Clips 1mm wire.stl

MATERIAL PLA, Weight: ~ 1 g

ADDITIONAL SETTINGS

None required

PROFILE P1_Fullbody **PLA or Tough PLA**

The following parts must be sliced with the PROFILE P1_Fullbody.
Please note the additional settings for the individual parts!

Carbon tool 8mm.stl

MATERIAL PLA, Weight: ~ 6 g

ADDITIONAL SETTINGS

None required

Use this tool to cut the 8mm carbon tubes.

PROFILE P2_Hollowbody **PLA or Tough PLA**

The following parts must be sliced with the PROFILE P2_Hollowbody.
Please note the additional settings for the individual parts!

P2_Battery mount_wp.stl

MATERIAL PLA, Weight: ~ 20 g

ADDITIONAL SETTINGS

Basic Information:

Gluing the parts printed with PROFILE P5

- STEP 1** As a first step, it is important to **roughen and smooth the adhesive surfaces** with sandpaper.
- STEP 2** Insert the **interconnects into the slots** provided on one side.
- STEP 3** Apply a **lot of glue** to the side with the interconnects. It is important that there is glue everywhere, especially on the outside and inside of the wall surfaces, in order to achieve a perfect connection. The interconnects only serve to align the parts to each other. It is better **not** to apply glue here, otherwise it can happen that the glue suddenly hardens while the parts are being put together and stops the process.

Use **medium viscosity CA glue**, thinner glue would run down the parts too easily.

After assembly, **align the two parts exactly** and wipe off the excess CA glue from the surface with a cloth. Now spray with activator spray along the gluing surface and carefully press the parts together.

- STEP 4** Clean the glued areas slightly with a **sharp-bladed cutter**.

PROFILES 5 parts are easy to repair

- STEP 1** Using the knife, carefully remove the damaged part about 3 mm from the glue joint between two parts.
- STEP 2** Cut wall and infill and clean the surface with sandpaper. **The top surface of the damaged part remains!**
- STEP 3** The remaining top surface is about 1 mm thick. To compensate for this, you can move the new part to be printed down the Z axis in Cura by 1 mm.

Fuselage assembly

Fuselage assembly

To test this part, screw the 3mm metal screws all the way in before gluing and check that they hold well. They must not be too loose. If this is the case, put some thin CA glue and activator spray in the holes and test again. **These screws must hold the horizontal stabilizer reliably!** This part must be well connected to the fuselage. Let thin CA glue run into the gaps.

Installing the hinges

First glue the hinges into the fuselage with **thin CA glue**. **Make sure that there is no glue on the exposed hinge to maintain flexibility.** To bond the rudder to the fuselage, use an adhesive that cures **slowly**, such as **UHU All Purpose Adhesive**. **Wet the hinges with a little glue**, and put glue in the gaps in the rudder, so that the movable part of the hinge between the fuselage and the rudder remains free of glue. Then push the rudder all the way to the fuselage and wait until the glue is dry.

Before the first flight, test whether the connection is firm.

Rear gear

Tighten the tapping screws just enough so that everything can be moved easily.

Upper wing fastening:

Insert the nuts into the hexagonal holes from below and screw in the metal screws from above. The screws are supposed to be heavy in the PLA, do NOT drill the hole. The nuts are only for additional security.

Then glue the nuts down WELL with medium or thick CA glue, taking care not to get any glue on the screw. Then test the nuts several times to make sure they are secure by completely unscrewing and reinserting the screw. **If a nut comes loose later and can turn, that's a problem.**

Then glue the whole part into the upper part of the fuselage 2. This connection must be very stable!

Metal screws Ø3*40mm

Tapping screws Ø2mm

Preparation of Fuselage 2:

Remove the protruding support caps on the sides where the wing will later be attached. Glue the brackets for the tension belts inside.

Remove support.
Please be careful with the knife!

Fuselage assembly

Super-Magnets – ensure correct alignment!

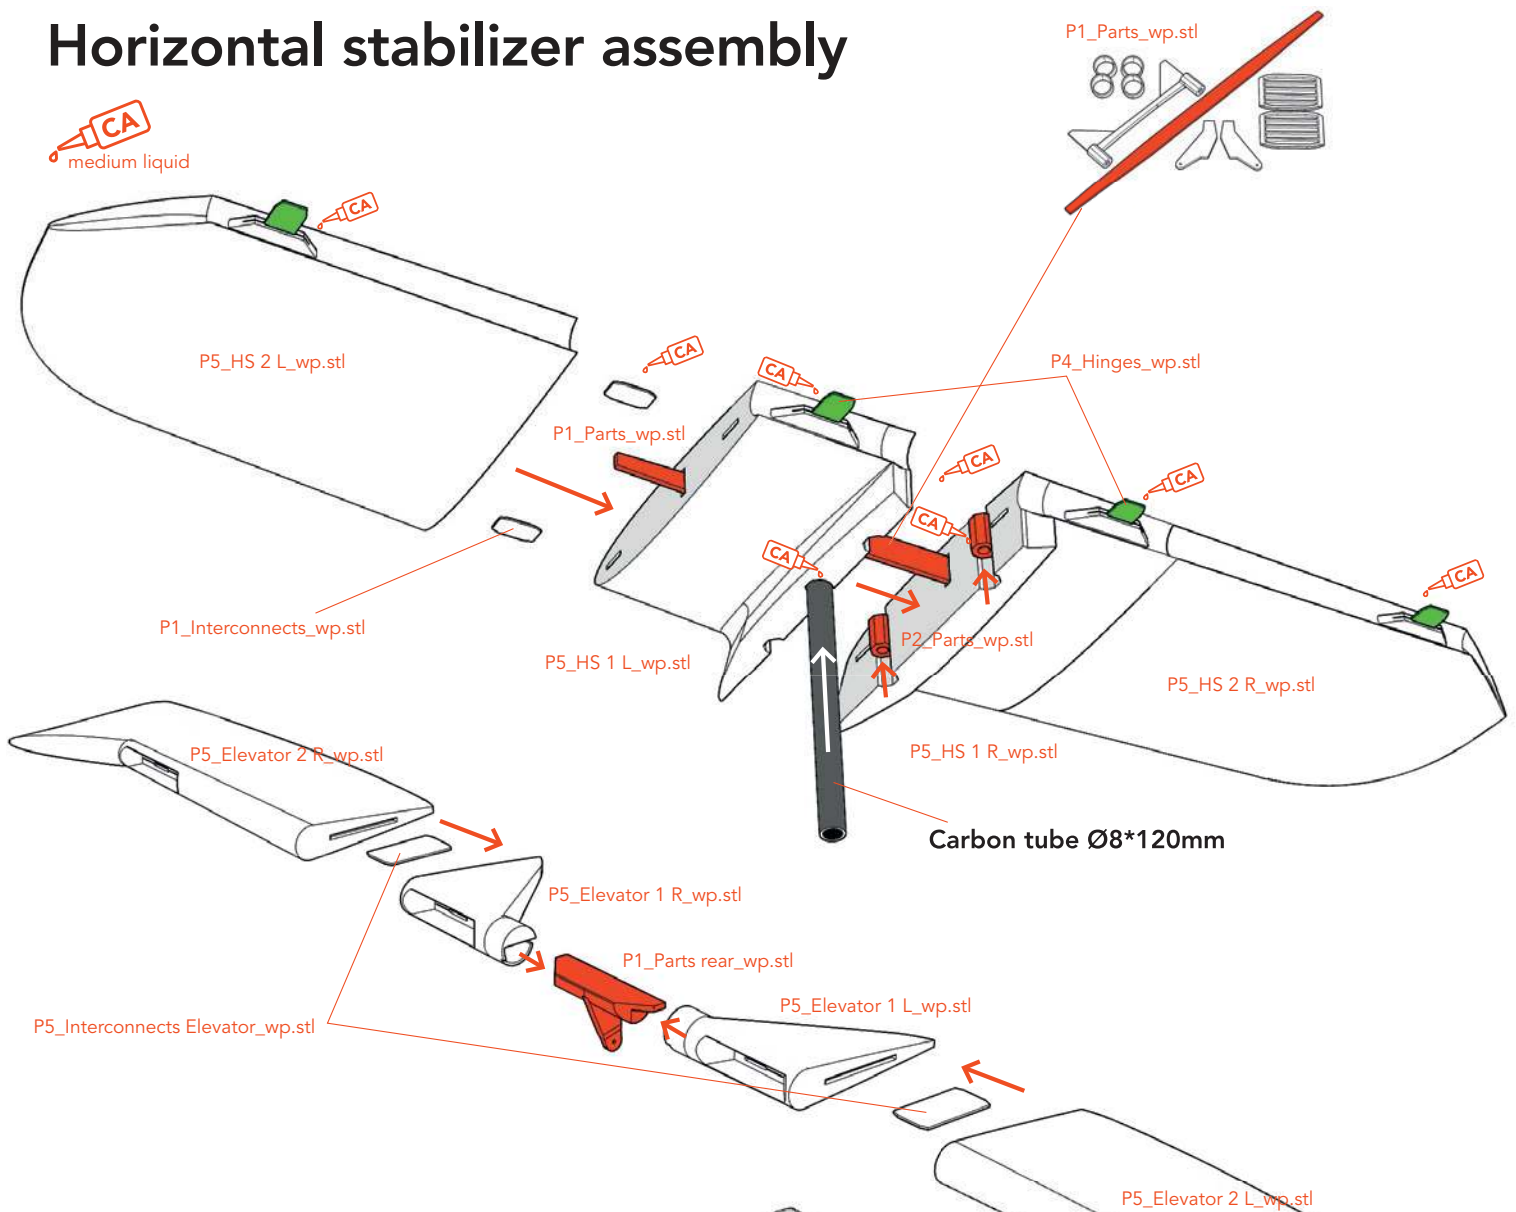

Fuselage assembly

Assemble the parts as shown in the picture. Then run **thin CA glue** over the entire surface of the motor mount and the carbon rods.
This glue connection is very important so that the motor is well fixed!

The side that was down on the buildplate **must face forward!**

Horizontal stabilizer assembly

Installing the hinges

To bond the elevator to the HS, use an adhesive glue that cures **slowly**, such as **UHU All Purpose Adhesive**. **Wet the hinges with a little glue**, and put glue in the gaps in the elevator, so that the movable part of the hinge between the HS and the elevator remains free of glue. Then push the elevator all the way to the fuselage and wait until the glue is dry.

Then glue the part HS 3 so that the elevator is not blocked. **Before the first flight, test whether the connection is firm.**

Lower wing assembly

Use the 8mm carbon tubes to glue the wing protectors in the optimal position on the wings.
Do not glue the tubes!

Carbon tube Ø8*500mm
 Carbon tube Ø8*800mm

Finally, install the hinges as described before.

Top wing assembly

Carbon tube Ø8*500mm
 Carbon tube Ø8*1000mm

The carbon tubes do not need to be glued in place, then you can reuse them if you ever need to reprint the upper wing.

Wing servos

Wing fastening

Fuselage servos

Rod connection

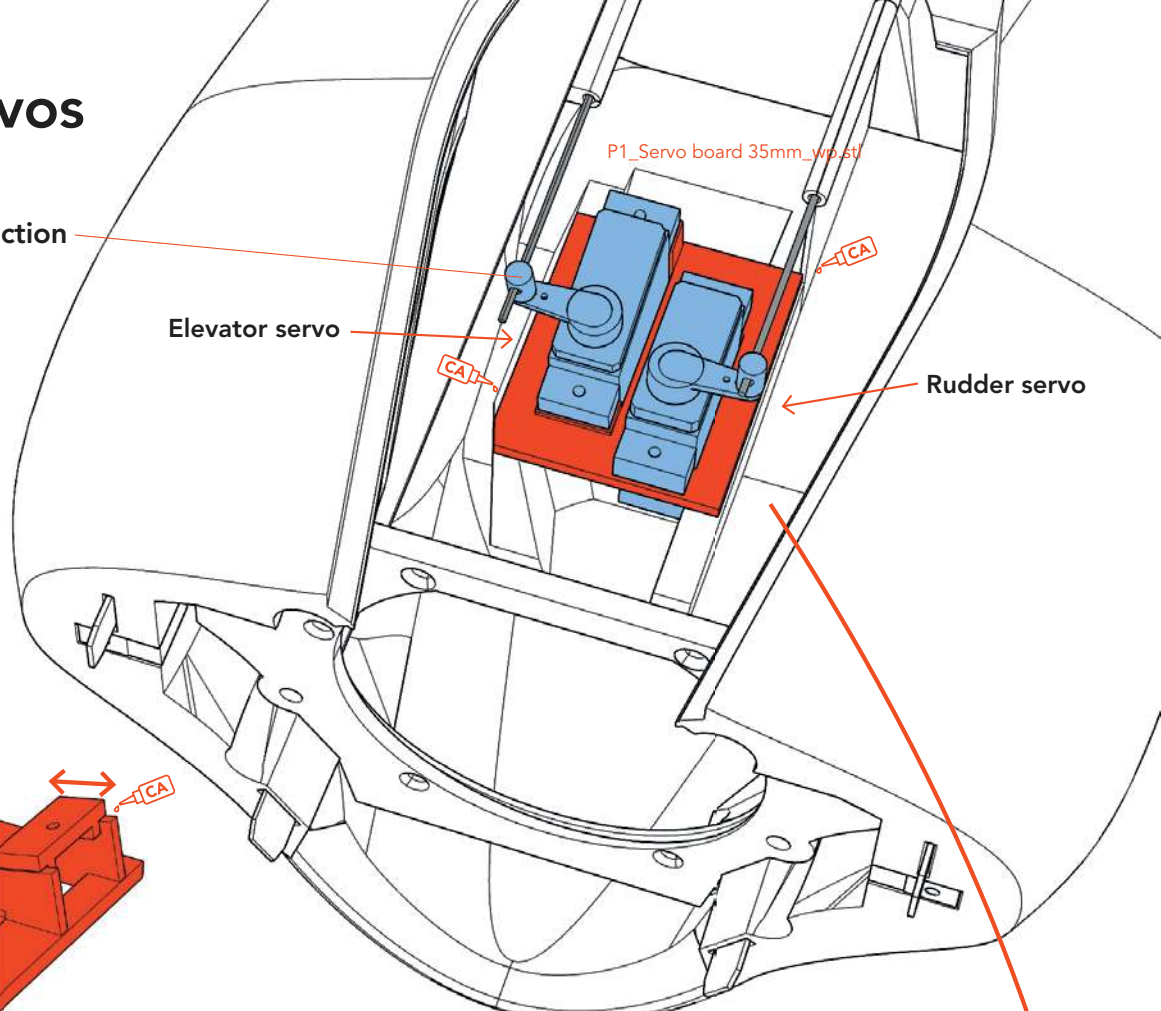

Elevator servo

Rudder servo

P1_Servo board 35mm_wp.stl

If your servos have a different format, you can use the customizable version.

P1_Servo board customizable_wp.stl

Thread the steel wire from behind through the Bowden cables and shorten it to the correct length.

Metal screws 3*30mm

Steel wire Ø1*1000mm

P1_Clips 1mm wire.stl

5 mm

Motor mounting

SAFETY FIRST Use appropriate screws for motor mounting to ensure safe operation! Make sure the prop runs smoothly and does not generate vibrations. **Check regularly that the motor mounting is absolutely tight!**

Mount the motor on the cross. The correct angle to the right and down is already set.

Cowling lock

This bar can be screwed behind the motor shaft to protect the battery.

Gear

NOTE The wheels must be **absolutely smooth-running**, otherwise there is a risk that the aircraft will roll over during landing! Therefore, make sure that all screws and parts of the gear are installed very precisely and that the wheel cannot drag anywhere. For this reason, we strongly recommend that you build the version **with ball bearings**.

Use about 3 or 4 hair gums to adjust the spring force. It should not be too tight.

Wing fastening

The gear is not glued to the wing but is held in place by the carbon tubes.
Hold it firmly during disassembly so that it can not fall down!

Battery fastening

First screw the battery plate to the two brackets and then glue them to the mounting rails in fuselage 1. you can unscrew the battery plate later if you need to replace a servo, for example.

Use self-adhesive Velcro strips and Velcro strips to attach the battery.

Attention: the slanted screws are on the rear side!

RC components

Use self-adhesive Velcro tape to attach the RC components.

Set the exact CG by positioning the battery and Lead (see next side).

Technical specifications

WINGSPAN 1100 mm/43.3 inches

LENGTH 1191 mm/46.9 inches

HEIGHT 435 mm/17.1 inches

FLIGHT WEIGHT 2870 grams

WING LOAD 49 g/dm²

Center of Gravity (CG)

The aircraft must balance **precisely** on these points and the nose should tend rather minimally downward. (**94 mm** behind the leading edge of the upper wing – **see the markings on the upper wing**).

Do not forget to check if the wings are exactly in balance in the roll axis. If one wing is heavier, correct this with a small weight on the wingtip.

Lead

There are two lead chambers in the nose so you can influence the center of gravity. Do not forget to fasten the lead well. You don't have to worry about increasing the wingload, it's more important that the CG is right.

Tips for flying

The Wanna Play II has a relatively high gear and you have to be careful when taxiing and taking off and landing that the nose does not go down, which can result in a rollover. Therefore it is important to always keep some elevator up, especially when you see the tail taking off. Therefore, it is very important that the wheels run very smoothly and do not brake even when cornering.

START The original is a real racer, but our model was not designed for the highest speeds, but for very good-natured general flight characteristics. It is better not to give full throttle right away, but to increase the engine power sensitively when starting up. The airfoil used generates lift very quickly during takeoff and you are in the air after a few meters. Your piloting skills should allow you to make corrections with the rudder!

LANDING You should plan a wide landing approach and have enough space to flare out, because the model glides very much. The touchdown on the ground should be as slow as possible, otherwise it is better to accelerate again and make a new approach. Try at high altitude how the model reacts in slow flight, then you will quickly get a feeling for it. In no case should you force the landing when the speed is still high (but this applies to most models).

The **landing angle** is perfect when the nose points slightly upwards (See the official Planeprint video).

Settings for flying

When checking the control directions, look at the aircraft from behind.

Aileron left

Expo setting

AILERON 30 % **ELEVATOR** 30 % **RUDDER** 30 %

(for some remote controls a minus has to be in front of the number)

AGE RECOMMENDATION 14+

NOT FOR CHILDREN UNDER 14 YEARS. THIS IS NOT A TOY!

The STL data (or data processed from it, such as G codes) must never be passed on to third parties!

The purchase of the STL does not authorize the production of models for third parties.

By using the download data, an RC model airplane, called „model“ for short, can be manufactured using a 3D printer. As a user of this model, only you are responsible for safe operation that does not endanger you or others, or that does not damage the model or property of others.

PLANEPRINT.com assumes no responsibility for damage to persons and property caused by pressure, transport or use of the product. Filaments, printing supplies, hardware or consumables that can not be used after faulty 3D printing will not be replaced by PLANEPRINT.com in any way.

When operating, always keep a safe distance from your model in all directions to avoid collisions and injuries.

This model is controlled by a radio signal. Radio signals can be disturbed from outside without being able to influence it. Interference can lead to a temporary loss of control.

Always operate your model on open terrains, far from cars, traffic and people.

Always follow the instructions and warnings for this product and any optional accessories (servos, receivers, motors, propellers, chargers, rechargeable batteries, etc.) carefully.

Keep all chemicals, small parts and electrical components out of the reach of children.

Avoid water contact with all components that are not specially designed and protected. Moisture damages the electronics.

Never take an item of the model or accessory in your mouth as this can lead to severe injuries or even death.

Never operate your model with low batteries in the transmitter or model.

Always keep the model in view and under control.
Use only fully charged batteries.

Always keep the transmitter switched on when the model is switched on.

Always remove the battery before disassembling the model.

Keep moving parts clean and dry at all times.

Always allow the parts to cool before touching them.

Always remove the battery after use.

Make sure that the Failsafe is properly set before the flight.

Never operate the model with damaged wiring.

Never touch moving parts.

We develop our models to the best of our knowledge and belief.
We accept no liability for consequential damage and injuries caused by improper use or incorrectly printed parts. **Please be careful when handling motors, batteries and propellers** and only move your model with insurance and in approved places!
